GENOMICS

UNIVERSITY OF  
**TORONTO**

# Genome Sequence Analysis

- **Genome sequence analysis** is critical for many applications
  - Personalized medicine
  - Outbreak tracing
  - Evolutionary studies
- Genome sequencing machines extract smaller fragments of the original DNA sequence, known as **reads**

# Genome Sequence Analysis

- **Read mapping:** first key step in genome sequence analysis
  - Aligns **reads** to potential **matching locations** in the **reference genome**
  - For each matching location, the **alignment step** finds the degree of **similarity (alignment score)**

- Calculating the alignment score requires **computationally-expensive approximate string matching (ASM)** to account for **differences** between reads and the reference genome due to:
  - Sequencing errors
  - Genetic variation

# Key Idea

*Filter reads that do not require alignment inside the storage system*

Filtered Reads

Main  
Memory

Cache

Computation  
Unit  
(CPU or  
Accelerator)

## Exactly-matching reads

Do not need expensive approximate string matching during alignment

## Non-matching reads

Do not have potential matching locations and can skip alignment

# Challenges

*Filter reads that do not require alignment inside the storage system*

Filtered Reads

Read mapping workloads can exhibit different behavior

There are **limited hardware resources** in the storage system

# GenStore

*Filter reads that do not require alignment inside the storage system*

Computation overhead

Data movement overhead

GenStore provides significant speedup (1.4x - 33.6x) and energy reduction (3.9x - 29.2x) at low cost

# Outline

Background

Motivation and Goal

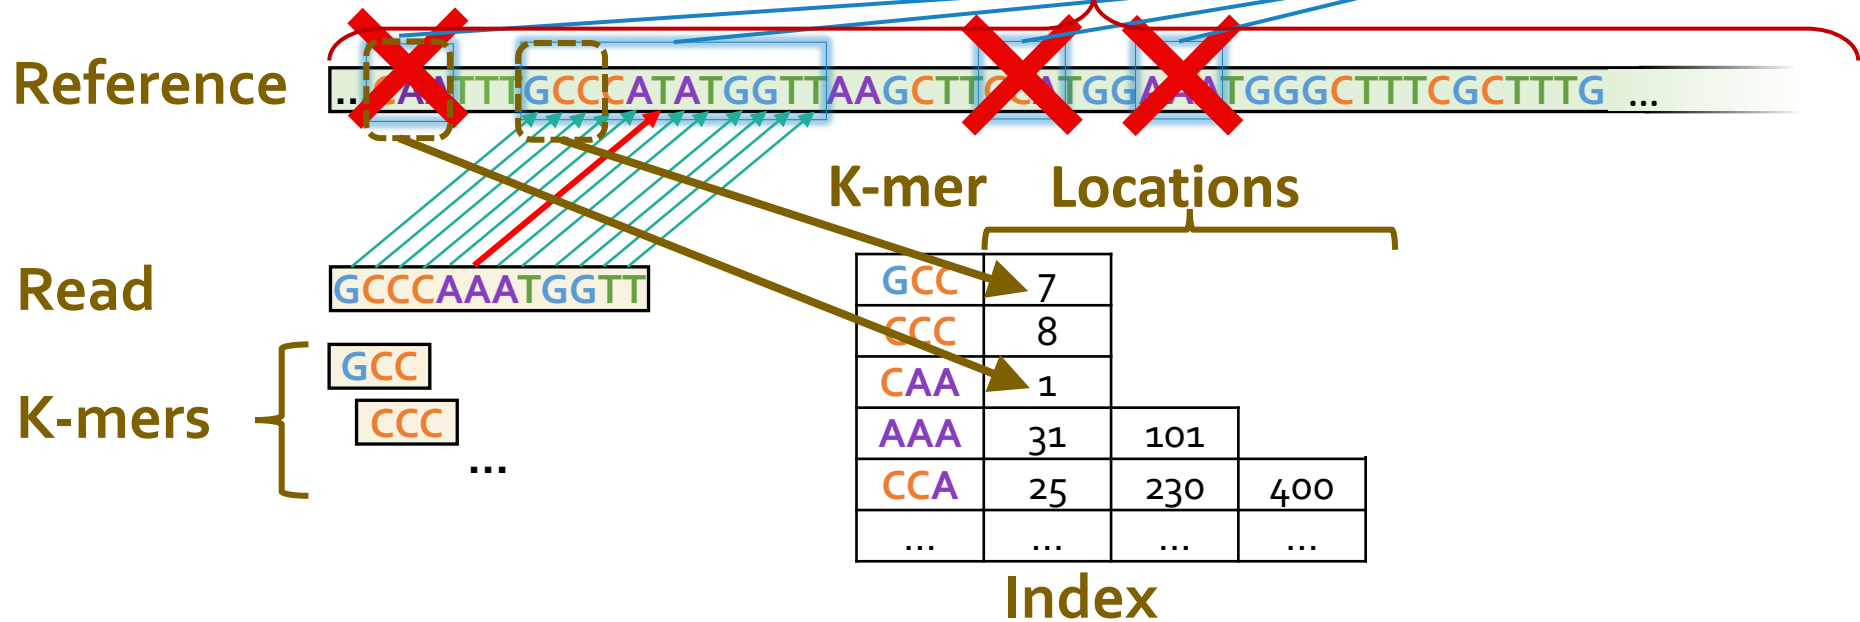

GenStore

Evaluation

Conclusions

# Read Mapping Process > 3 billion characters Seeds

- Seeding** Determine potential matching locations (seeds) in the reference genome
- Seed Filtering (e.g., Chaining)** Prune some seeds in the reference genome
- Alignment** Determine the exact differences between the read and the reference genome

# Read Mapping Process > 3 billion characters

- Seeding** Determine potential matching locations (seeds) in the reference genome
- Seed Filtering (e.g., Chaining)** Prune some seeds in the reference genome
- Alignment** Determine the exact differences between the read and the reference genome

# Outline

Background

Motivation and Goal

GenStore

Evaluation

Conclusions

# Motivation

- Case study on a real-world genomic read dataset
  - Various read mapping systems
  - Various state-of-the-art SSD configurations

**The ideal in-storage filter significantly improves performance by**

- 1) **reducing the computation overhead**
- 2) **reducing the data movement overhead**

# Motivation

- Case study on a real-world genomic read dataset
  - Various read mapping systems
  - Various state-of-the-art SSD configurations

**Filtering outside SSD provides lower performance benefit since it**

- 1) does not reduce the data movement overhead**
- 2) must compete with read mapping for system resources**

**A HW accelerator reduces the computation bottleneck,  
which makes I/O a larger bottleneck in the system**

# Our Goal

*Design an in-storage filter for genome sequence analysis  
in a cost-effective manner*

## Design Objectives:

### Performance

Provide high in-storage filtering performance to **overlap the filtering with the read mapping** of unfiltered data

### Applicability

Support reads with 1) different **properties** and 2) different degrees of **genetic variation** in the compared genomes

### Low-cost

Do not require significant hardware **overhead**

# Outline

Background

Motivation and Goal

GenStore

Evaluation

Conclusions

# GenStore

- **Key idea:** Filter reads that do not require alignment **inside the storage system**
- **Challenges**
  - **Different behavior** across read mapping workloads
  - **Limited** hardware resources in the SSD

# Filtering Opportunities

- Sequencing machines produce one of two kinds of reads
  - **Short reads:** highly accurate and short
  - **Long reads:** less accurate and long

## Reads that do not require the expensive alignment step:

### Exactly-matching reads

Do not need expensive approximate string matching during alignment

- Low sequencing error rates (short reads) combined with
- Low genetic variation

### Non-matching reads

Do not have potential matching locations, so they skip alignment

- High sequencing error rates (long reads) or
- High genetic variation (short or long reads)

# GenStore

GenStore-**EM** for Exactly-Matching Reads

GenStore-**NM** for Non-Matching Reads

# GenStore

GenStore-EM for Exactly-Matching Reads

GenStore-NM for Non-Matching Reads

# GenStore-EM

- Efficient in-storage filter for reads with at least one **exact match** in the reference genome
- Uses **simple operations**, without requiring alignment
- **Challenge:** large number of **random accesses per read** to the reference genome and its index

**Expensive random accesses** to flash chips

**Limited DRAM capacity** inside the SSD

# GenStore-EM: Data Structures

- **Read-sized k-mers:** to reduce the number of accesses per each read

- **Sorted read-sized k-mers:** to avoid random accesses to the index

# GenStore-EM: Data Structures

## Sorted Read Table

# GenStore-EM: Not Finding a Match

Sorted Read Table

	Read
	AAAAAAAAAAAA

Sorted K-mer Index

K-mer	
AAAAAAAAAAAA	

**Avoids random accesses**

**Simple low-cost logic**

Comparator

Read < K-mer

Not an exact match → Send to read mapper

# GenStore-EM: Optimization

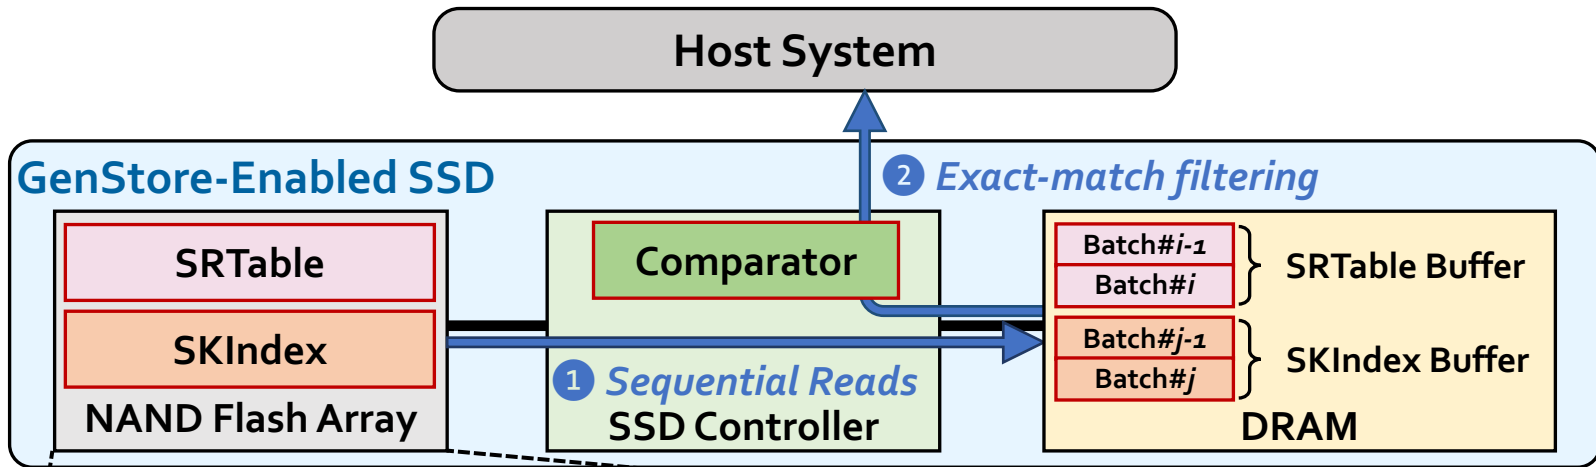

- Read-sized k-mer index takes up a **large amount of space** (126 GB for human index) due to the larger number of unique k-mers

## Sorted K-mer Index

Strong Hash Value	Loc.
1	1, 8, ...
4	51
7	23, 37
16	...

Using strong hash values instead of read-sized k-mers  
reduces the size of the index by 3.9x

# GenStore-EM: Design

Steps 1 and 2 are **pipelined**.

During filtering, GenStore-EM sends the unfiltered reads to the host system.

Data is evenly distributed between channels, dies, and planes to **leverage the full internal bandwidth** of the SSD

# GenStore

GenStore-EM for Exactly-Matching Reads

GenStore-NM for Non-Matching Reads

Details on GenStore-NM's design are in the paper

Conclusions

# Evaluation Methodology

## Read Mappers

- **Base:** state-of-the-art software or hardware read mappers
  - **Minimap2** [Bioinformatics'18]: software mapper for **short and long reads**
  - **GenCache** [MICRO'19]: hardware mapper for **short reads**
  - **Darwin** [ASPLOS'18]: hardware mapper for **long reads**
- **GS:** Base integrated with GenStore

## SSD Configurations

- **SSD-L:** with **SATA<sub>3</sub>** interface (**0.5 GB/s** sequential read bandwidth)
- **SSD-M:** with **PCIe Gen<sub>3</sub>** interface (**3.5 GB/s** sequential read bandwidth)
- **SSD-H:** with **PCIe Gen<sub>4</sub>** interface (**7 GB/s** sequential read bandwidth)

# Performance – GenStore-EM

For a read set with 80% exactly-matching reads

With the Software Mapper

With the Hardware Mapper

2.1x - 2.5x speedup compared to the software Base

1.5x – 3.3x speedup compared to the hardware Base

On average 3.92x energy reduction

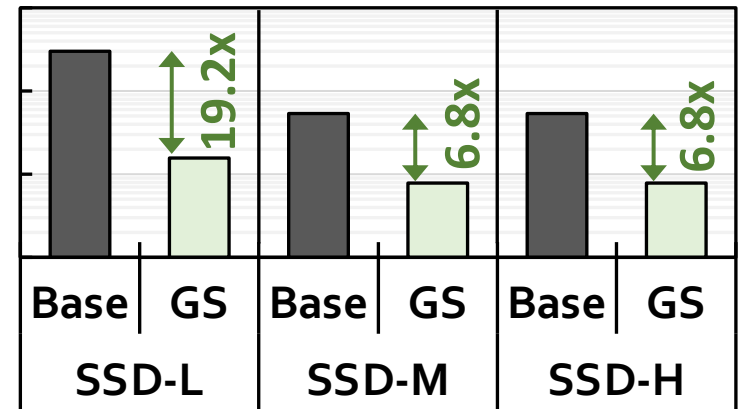

# Performance – GenStore-NM

For a read set with 99.7% non-matching reads

With the Software Mapper

With the Hardware Mapper

22.4x – 27.9x speedup compared to the software Base

6.8x – 19.2x speedup compared to the hardware Base

On average 27.2x energy reduction

# More in the Paper

- Effect of **read set features** on performance
  - **Data size** (up to 440 GB)
  - **Filter ratio**
- Performance benefit of an implementation of GenStore **outside the SSD**
  - In some cases, it provides performance benefits due more efficient **streaming accesses**
  - Provides **significantly lower benefit** compared to GenStore
- More detailed characterization of non-matching reads across different **read mapping use cases and species**

Motivation and Goal

MegIS

Evaluation

Conclusion

# Motivation

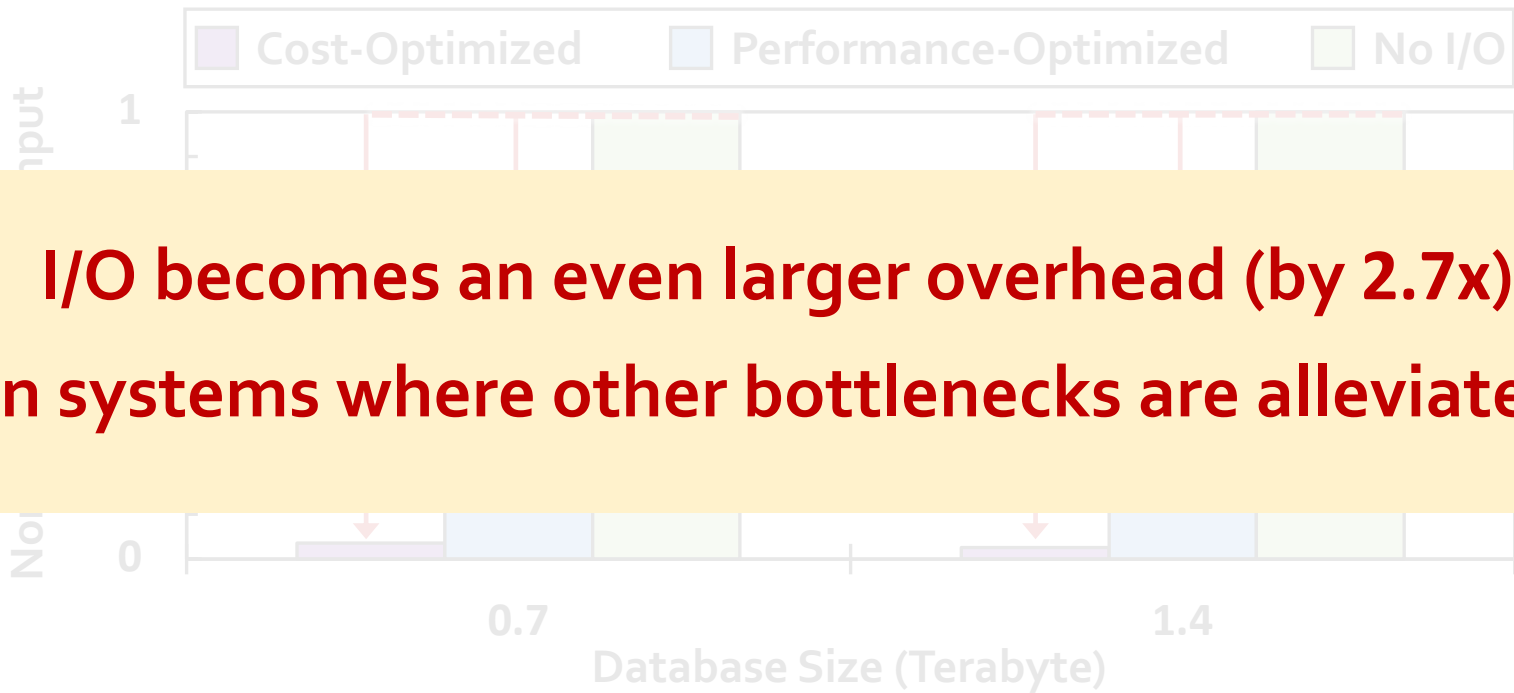

- Case study of the performance of metagenomic analysis tools
- With various state-of-the-art SSD configurations

**I/O data movement causes significant performance overhead**

# Motivation

- Case study on the throughput of metagenomic analysis tools
- With Various state-of-the-art SSD configurations

**I/O becomes an even larger overhead (by 2.7x)  
in systems where other bottlenecks are alleviated**

I/O data movement causes significant performance overhead

# I/O Overhead is Hard to Avoid

I/O overhead due to accessing **large, low-reuse** data is hard to avoid

## Sampling techniques to shrink database sizes

*[Wood+, Genome Biology'19], [Ounit+, BMC Genomics'15], [Kim+, Genome Research'16], ...*

**✗** *Reduce accuracy to levels unacceptable for many use cases*

Keeping all data required by metagenomic analysis completely and always resident in main memory

**✗** *Energy inefficient, costly, unscalable, and unsustainable*

- Database sizes **increase rapidly** (doubling every few months)
- Different analyses need **different databases**

# Our Goal

*Improve metagenomic analysis **performance**  
by reducing large **data movement overhead**  
from the storage system  
in a **cost-effective** manner and with **high accuracy***

# Challenges of In-Storage Processing

No metagenomic analysis tools can run in-storage due to SSD limits

- Long **latency of NAND flash** chips
- Limited **DRAM capacity** inside the SSD
- Limited **DRAM bandwidth** inside the SSD

# Outline

Background

Motivation and Goal

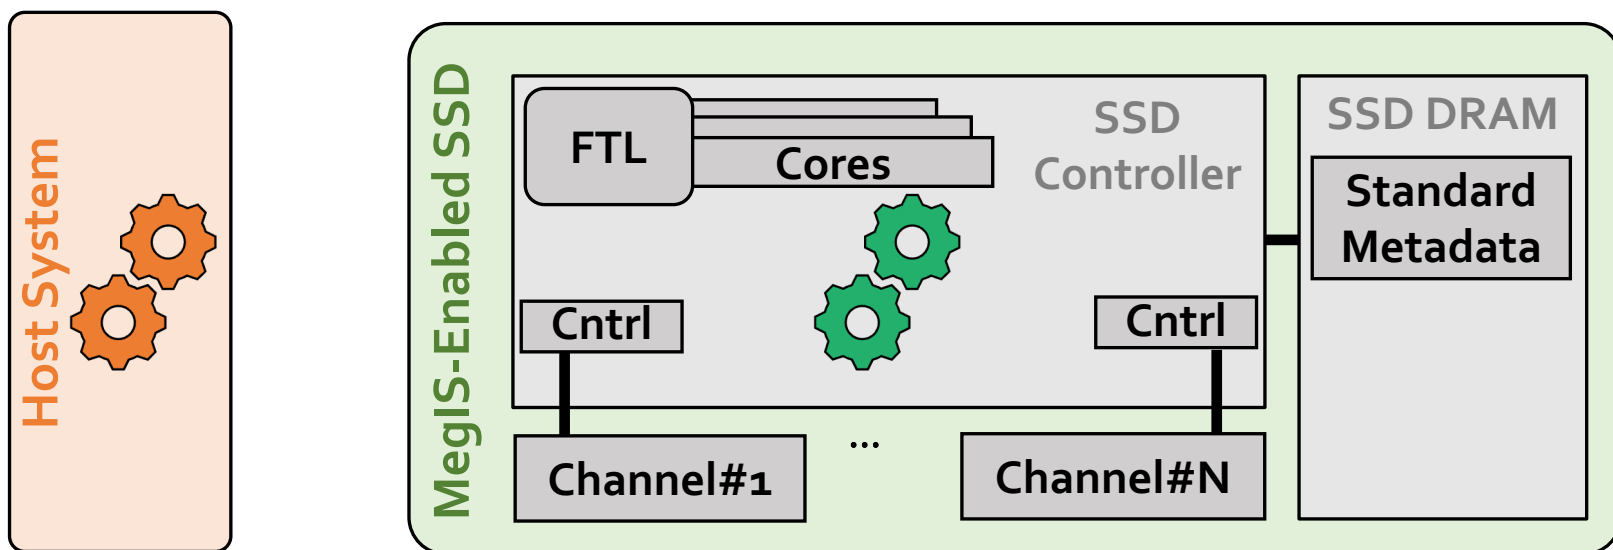

MegIS

Evaluation

Conclusion

# MegIS: Metagenomics In-Storage

# Backup Slides

# End-to-End Workflow of Genome Sequence Analysis

- There are **three key initial steps** in a standard genome sequencing and analysis workflow
  - Collection, preparation, and sequencing of a DNA sample in the laboratory
  - Basecalling
  - Read mapping
- Genomic read sets can be obtained by
  - Sequencing a DNA sample and **storing the generated read set into the SSD of a sequencing machine**
  - Downloading read sets from **publicly available repositories and storing them into an SSD**
- We focus on optimizing the performance of read mapping because sequencing and basecalling are performed only once per read set, whereas read mapping can be performed many times
  - Analyzing the differences between a reads from an individual and **many reference genomes of other individuals**
  - Repeating the read mapping step many times **to improve the outcome of read mapping**
- Improving read mapping performance is critical in almost all genomic analyses that use sequencing
  - 45% of the execution time when discovering **sequence variants in cancer genomics** studies
  - 60% of the execution time when profiling the species composition of **a multi-species (i.e., metagenomic) read**

# Motivation

# Motivation

State-of-the-art software read mapper, Minimap2

Base integrated with a software filter that prunes **80%** of exactly-matching reads

Base integrated with an ideal in-storage filter

# Motivation

Low-end SSD with SATA3 interface (0.5 GB/s)

High-end SSD with PCIe Gen4 interface (7 GB/s)

Data preloaded in DRAM, with no I/O overhead

# Benefits of Ideal In-Storage Filter

The ideal in-storage filter significantly improves performance by

- 1) Reducing computation overhead
- 2) Reducing data movement overhead

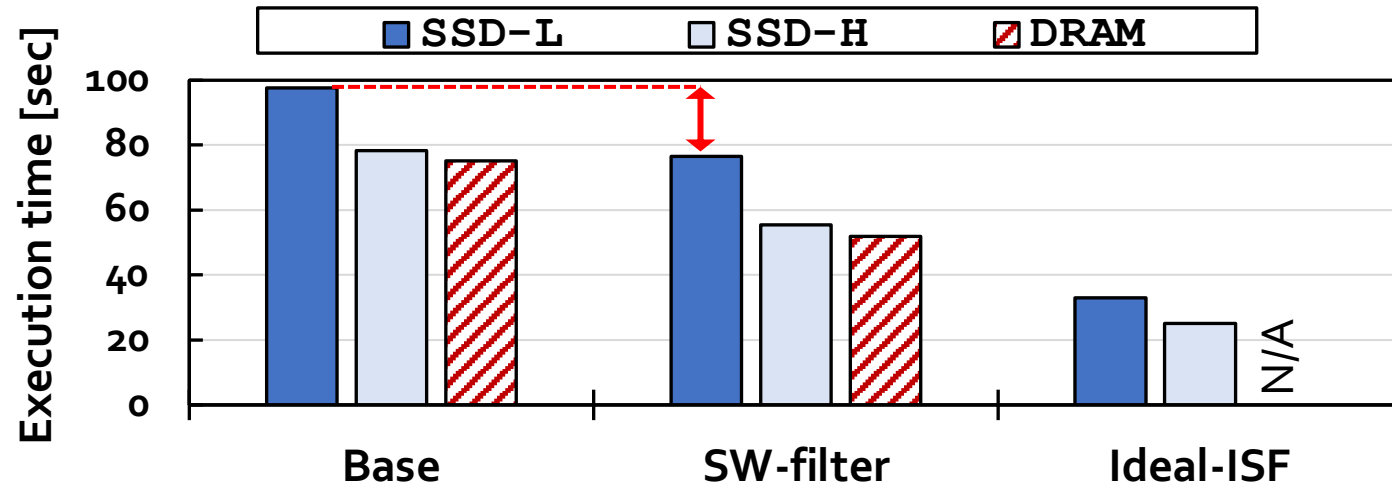

# Overheads of Software Mappers

I/O has a **significant impact** on application performance which can be alleviated at the cost of **expensive** storage devices and interfaces

# Overheads of Software Mappers

SW-filter provides limited benefits compared to Base

The filtering process **outside the SSD** must **compete** with the read mapping process for the resources in the system

# Overheads of Hardware Mappers

Even the high-end SSD **does not fully alleviate** the storage bottleneck

The ideal in-storage filter significantly improves performance

# Ideal-OSF

- Execution time of an **ideal in-storage filter**:

$$T_{\text{Ideal-ISF}} = T_{\text{I/O-Ref}} + \max \{ T_{\text{I/O-Unfiltered}}, T_{\text{RM-Unfiltered}} \}$$

- Execution time of an **ideal outside-storage filter**:
  - **60% slower** than Ideal-ISF in our analysis

$$T_{\text{Ideal-OSF}} = T_{\text{I/O-Ref}} + \max \{ T_{\text{I/O-All-Reads}}, T_{\text{RM-Unfiltered}} \}$$

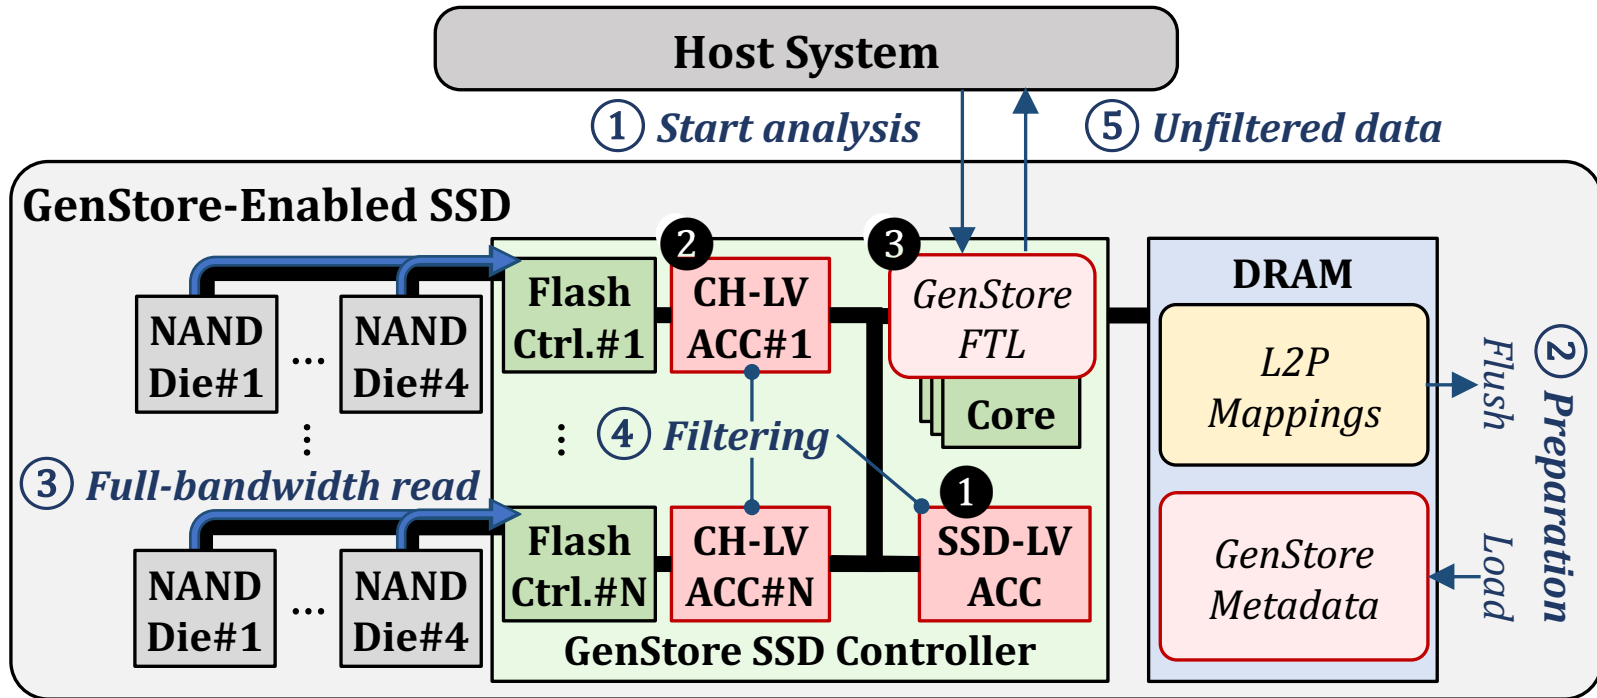

# Comparison to PIM

- Even though read mapping applications could also benefit from other near-data, in-storage processing can fundamentally address the data movement problem by filtering **large, low-reuse data** where the data initially resides.
- Even if an ideal accelerator achieved a zero execution time, there would still exist the need to bring the data from storage to the accelerator.
  - **2.15x slower** than the execution time that Ideal-ISF+ACC provides in our motivational analysis

**In-storage filter can be integrated with any read mapping accelerator, including PIM accelerators, to alleviate their data movement overhead.**

# Long Read Use Cases

Use case	Input read set (Short/Long)	Size [GB]	Reference	Align [%]
Sequencing errors	ERR3988483 (L) [157]	54	hg38 [144]	47.4
	HG002_ONT_20200204 (L) [158]	371		69.3
Rapidly evolving samples	SRR5413248 (L) [157]	1.69	NZ_NJEX02 [159]	60.0
	SRR12423642 (S) [157]	0.466	NC_045512.2 [160]	23.1
No reference	SRR6767727 (L) [157]	12.4	NZ_NJEX02 [159]	0.35
	SRR9953689 (L) [157]	15.9		37.0
Contamination	SRR9953689 (L) [157]	15.9	hg38 [144]	1.0

# FTL: Metadata

- GenStore metadata includes the **mapping information** of the data structures necessary for read mapping acceleration
- In accelerator mode, GenStore also keeps in internal DRAM other metadata structures of the regular FTL
  - Examples include the **page status table and block read counts** which need to be updated during the filtering process
- We carefully design GenStore to only **sequentially access** the underlying NAND flash chips while operating as an accelerator
  - Requires **only a small amount of metadata** to access the stored data

# FTL: Data Placement

- GenStore needs to properly place its data structures to enable the **full utilization of the internal SSD bandwidth**
- When each data structure is initially written to the SSD, GenStore **sequentially and evenly** distributes it across NAND flash chips
- GenStore can specify the physical location of a 30-GB data structure by maintaining only the list of 1,250 (30 GB/24 MB) physical block addresses
- It significantly reduces the size of the necessary mapping information from **300 MB** (with conventional 4-KiB page mapping) to only **5 KB** (1,250  $\times$  4 bytes)

# FTL: SSD Management Tasks

- In accelerator mode, GenStore only reads data structures to perform filtering, and does not write any new data
  - GenStore does not require any write-related SSD-management tasks such as **garbage collection** and **wear-leveling**
- The other tasks necessary for ensuring data reliability can be done before or after the filtering process
  - GenStore significantly limits the amount of data whose **retention age** would exceed the manufacturer-specified threshold since GenStore's filtering process takes a short time.
  - GenStore-FTL can easily **avoid read disturbance errors** for data with high read counts since GenStore sequentially reads NAND flash blocks only once during filtering

# Data Sizes

- Conventional k-mer index in Minimap2 + reference genome: 7 GB (k = 15)
- Read-sized k-mer index before optimization: 126 GB (k= 150)
- Read-sized k-mer index after optimization: 32 GB (k = 150)

# SSD Specs

- **SSD-L:** SATA3 interface (0.5 GB/s sequential read)
  - 1.2 GB/s per channel bandwidth
  - 8 channels
- **SSD-L:** PCIe Gen3 M.2 interface (3.5 GB/s sequential read)
  - 1.2 GB/s per channel bandwidth
  - 16 channels
- **SSD-L:** PCIe Gen4 interface (7 GB/s sequential read)
  - 1.2 GB/s per channel bandwidth
  - 16 channels

# Evaluation Methodology

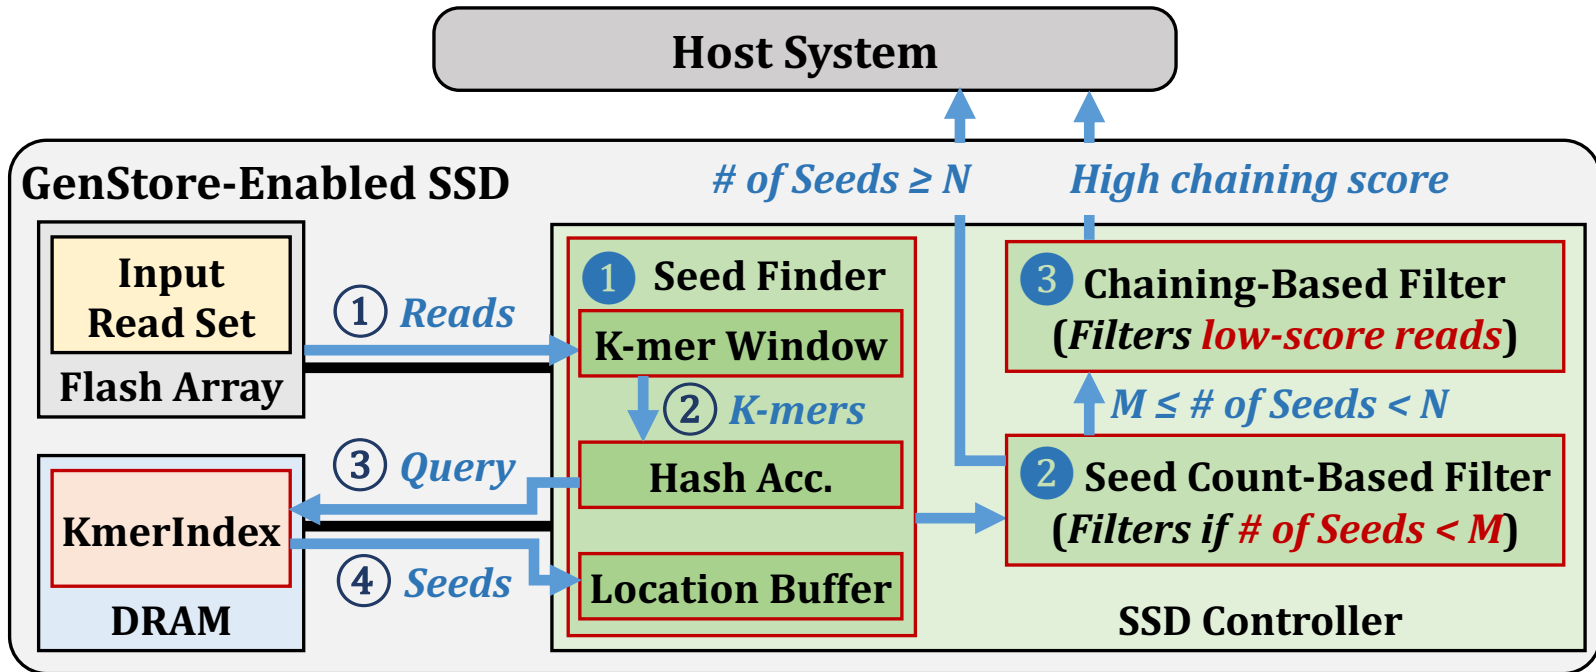

- **Performance modeling**

- Ramulator for DRAM timing
- MQSim for SSD timing
- We model the end-to-end throughput of GenStore based on the throughput of each GenStore pipeline stage
  - Accessing NAND flash chips
  - Accessing internal DRAM
  - Accelerator computation
  - Transferring unfiltered data to the host

- **Real system results**

- AMD EPYC 7742 CPU
- 1TB DDR4 DRAM
- AMD  $\mu$ Prof

# GenStore-NM

# Chaining Processing Element

# GenStore-EM

**GS-Ext provides significant performance improvements over both Base and SIMD in SSD-M and SSD-H.**

**GS-Ext provides limited benefits over SIMD in SSD-L due to low external I/O bandwidth.**

# GenStore-NM

**GS-Ext performs significantly slower than Base (2.28x - 1.91x)  
on all systems.**

# Effect of Inputs on GenStore-EM

$$DM\_Saving = \frac{Size_{Ref} + Size_{ReadSet}}{Size_{Ref} + Size_{ReadSet} \times (1 - Ratio_{Filter})}$$

# Effect of Inputs on GenStore-NM

$$DM\_Saving = \frac{Size_{Ref} + Size_{ReadSet}}{Size_{Ref} + Size_{ReadSet} \times (1 - Ratio_{Filter})}$$

# Multi-Sample Use Case

# Area and Power

- Based on **synthesis** of **MegIS** accelerators using the Synopsys Design Compiler @ 65nm technology node

Logic Unit	# of instances	Area [mm <sup>2</sup> ]	Power [mW]
Intersect (120-bit)	1 per channel	0.001361	0.284
k-mer Registers (2 x 120-bit)	1 per channel	0.002821	0.645
Index Generator (64-bit)	1 per channel	0.000272	0.025
Control Unit	1 per SSD	0.000188	0.026
<b><i>Total for an 8-channel SSD</i></b>	-	<b><i>0.04</i></b>	<b><i>7.658</i></b>

Only **1.7%** of the area of three 28-nm ARM Cortex R4 cores  
in a SATA SSD controller

# Step 1 Overview

Metagenomic sample with species that are **not known** in advance

A large database containing information on **many species**

**Step 1**

Preparation of Input Queries

Query K-mers

GCTCA  
CTCAT  
TCATG  
...

**Step 2**

Presence/Absence Identification

V. cholerae

SARS-CoV-2

E. coli

**Step 3**

Abundance Estimation

# Step 1 Overview

*MegIS employs sorted data structures to avoid expensive random accesses to the SSD*

- **Extract k-mers** from the sample
- **Sort** the k-mers (database is sorted offline)

*MegIS executes Step 1 in the host system*

- Benefits from **larger DRAM** and **more powerful computation**
- Incurs **fewer writes** to NAND flash chips (than processing this step in the SSD)
- Enables **overlapping** Step 1 with Step 2

*To execute Step 1 efficiently in the host system, MegIS needs to:*

- Avoid significant overhead due to **data transfer time** between the steps
- Minimize **performance** and **lifetime** overheads *even* when host DRAM cannot hold all query k-mers

# Step 1 Design

Divide k-mers into **independent partitions** by their alphabetical range

✓ Can overlap operations on different partitions

# Step 2 Overview

Metagenomic sample with species that are not known in advance

A large database containing information on **many species**

**Step 1**

Preparation of Input Queries

Query K-mers

GCTCA  
CTCAT  
TCATG  
...

**Step 2**

Presence/Absence Identification

V. cholerae

SARS-CoV-2

E. coli

**Step 3**

Abundance Estimation

# Step 2 Overview

- **Identify the common k-mers** between the query k-mers and the database k-mers
- **Retrieve the species IDs** of the common k-mers

*MegIS executes Step 2 in the SSD*

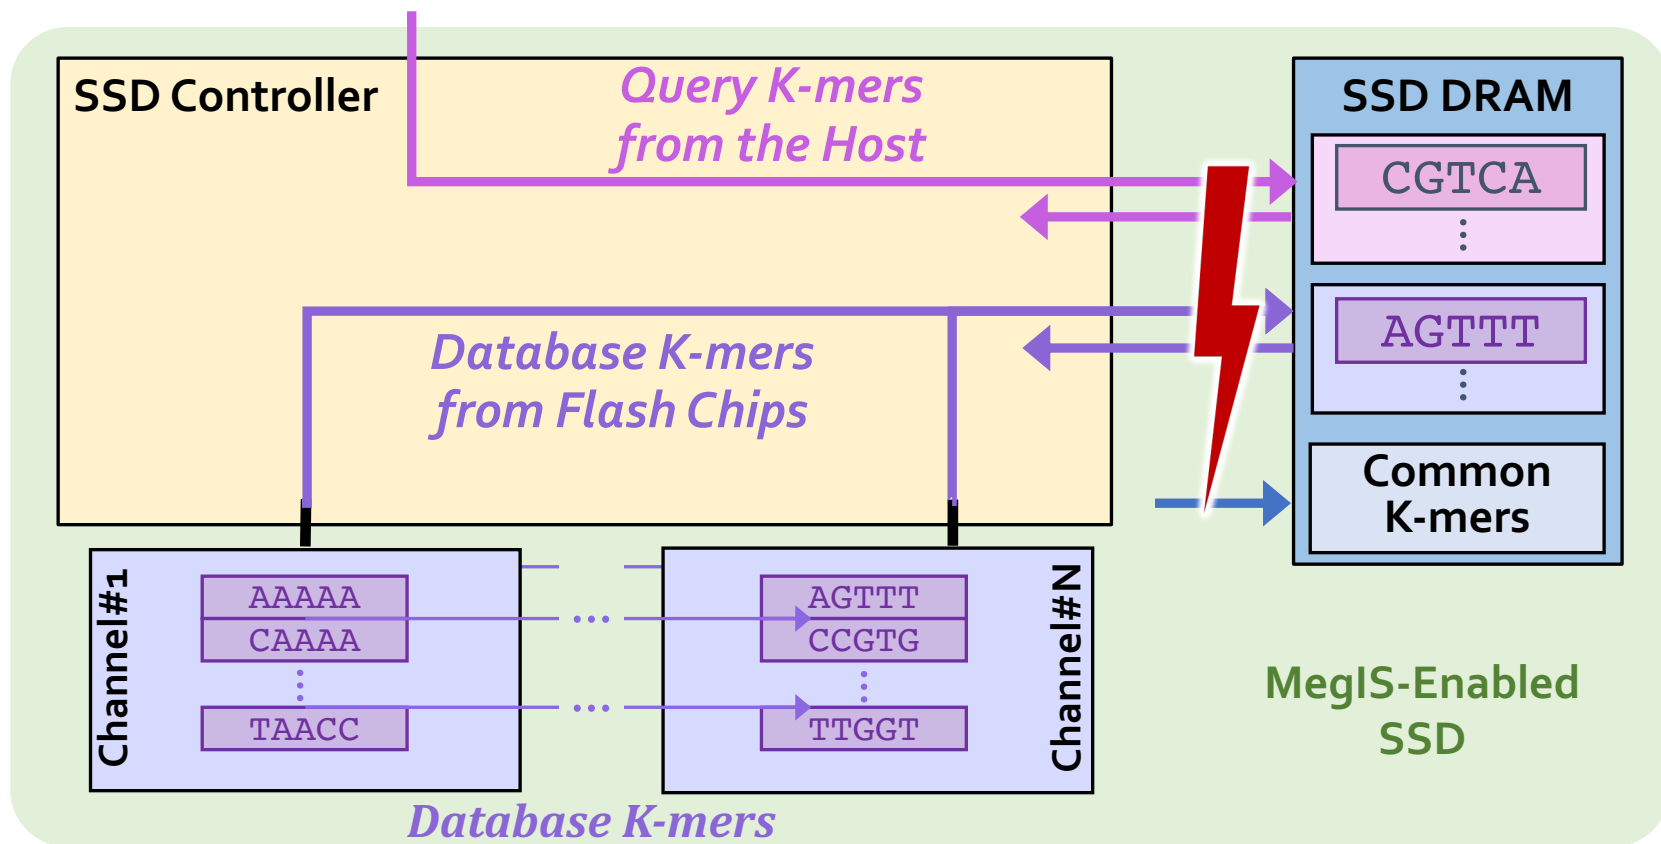

- Accesses **large data** with **low reuse**
- Involves **lightweight computation**

*To execute Step 2 efficiently in the SSD, MegIS needs to:*

- Leverage **internal bandwidth** efficiently
- Not require **expensive hardware inside the SSD**  
(e.g., large DRAM bandwidth/capacity and costly logic units)

# Step 2 Design: Identifying the Common K-mers

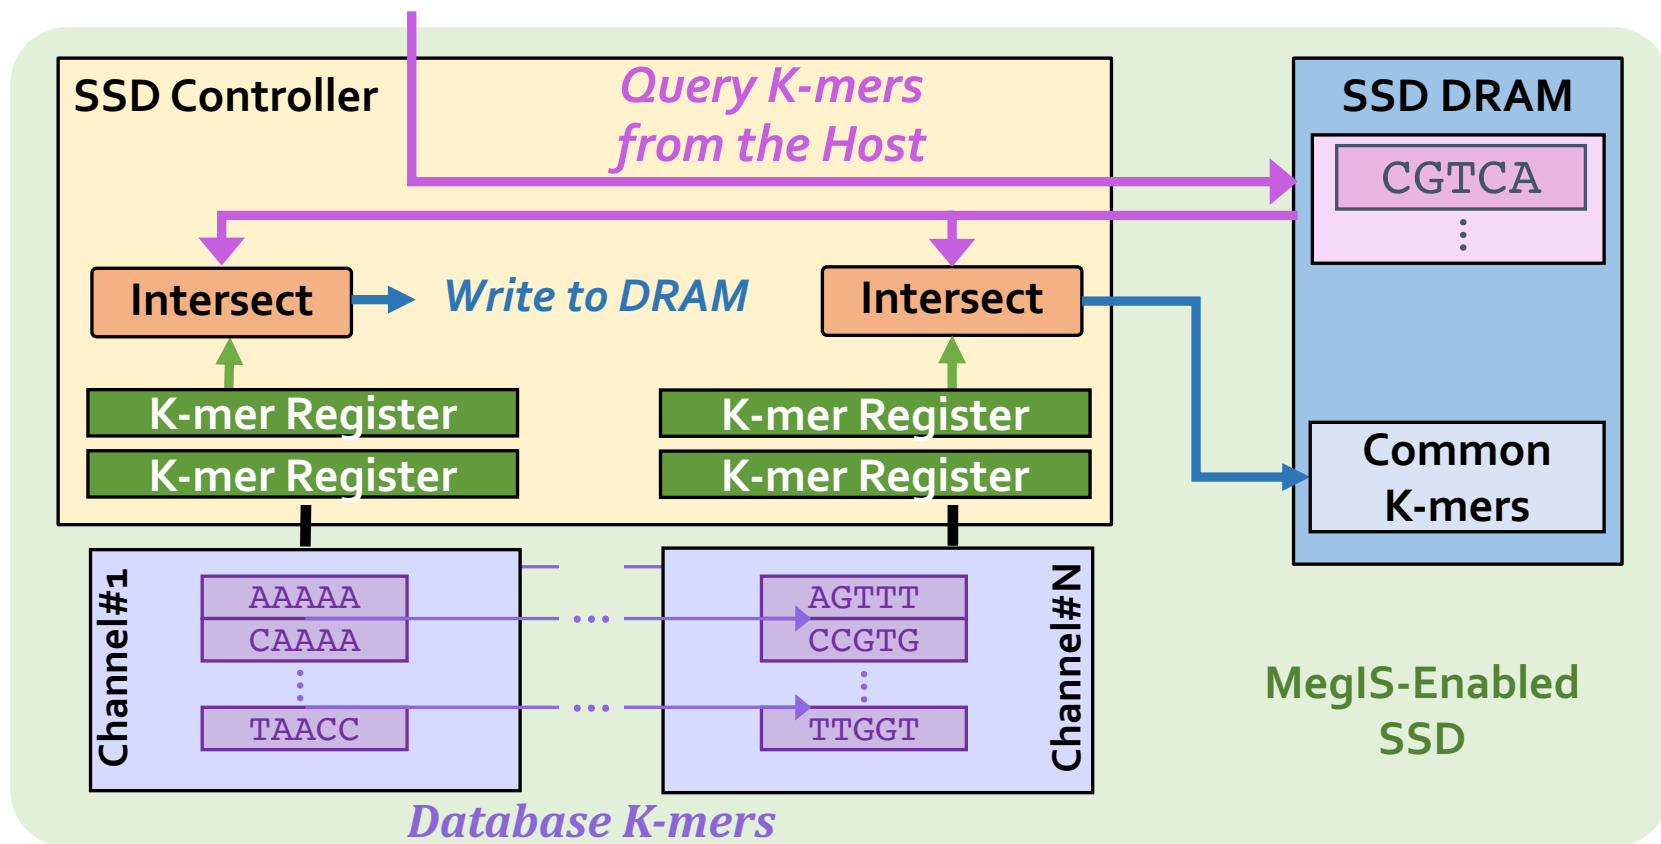

- **Challenge:** Limited internal DRAM bandwidth

# Step 2 Design: Identifying the Common K-mers

- **Challenge:** Limited internal DRAM bandwidth

- ✓ *Compute directly on the flash data streams* [Zou+, MICRO'22]
- ✓ *Reduce buffer size based on application features*

# Step 2 Design: Retrieving the Species ID

- MegIS retrieves the species IDs of the **common k-mers** by looking up a **sketch database**

K-mer

AAAAC	
AATCC	
...	

Space-Inefficient

Space-Efficient

✗ *Slow inside the SSD  
due to long  
NAND flash latency*

# Step 2 Design: Retrieving the Species ID

- MegIS retrieves the species IDs of the **common k-mers** by looking up a **sketch database**

K-mer	ID
AAAAA	1,5
AAAAC	6
AATCC	2,9
...	...

Space-Inefficient

Space-Efficient

7.5x Smaller

2.1x Larger

K-mer Sketch Streaming

*K-mer Sketch Streaming is much more suitable for in-storage processing due to its streaming accesses*

# Step 2 Design: Retrieving the Species ID

- MegIS retrieves the species IDs of the **common k-mers** by looking up a **sketch database**

K-mer	ID
AAAAAA	15

Design details are in the paper

Space-efficient

Space-Efficient

7.5x Smaller

2.1x Larger

K-mer Sketch Streaming

*K-mer Sketch Streaming is much more suitable for in-storage processing due to its streaming accesses*

# Step 3

Metagenomic sample with species that are **not known** in advance

A large database containing information on **many species**

## Step 1

Preparation of Input Queries

Query K-mers

GCTCA  
CTCAT  
TCATG  
...

## Step 2

Presence/Absence Identification

V. cholerae

SARS-CoV-2

E. coli

## Step 3

Abundance Estimation

# Step 3

Abundance Estimation

MegIS performs additional analysis on species identified in the sample to estimate their abundance

## *MegIS can flexibly integrate with different approaches*

1. **Lightweight statistical approaches:** Directly uses the output of Step 2
2. **More accurate and costly read mapping:** MegIS facilitates integration by preparing mapping indexes in the SSD
